

AI Monitoring and Measurement Best Practices

Introduction

These best practice examples showcase how leading organizations successfully monitor and measure the success of AI investments.

HR leaders can use this presentation to:

- 1 Get inspired by best practices from HR and enterprise leaders
- 2 Gain visibility into how to achieve AI deployment goals
- 3 Understand best practices for AI deployment

Methodology:

Best practice examples were sourced from extensive interviews with HR and enterprise leaders. Examples were also obtained from existing case studies on Gartner.com, which have been cited in this presentation.*

* Some content may not be available as part of your current Gartner subscription.

SACE (AI Time Save and Use Framework to Drive Growth)

Source: [Case Study: AI Time Save and Use Framework to Drive Growth](#)

AI Time Save and Use Framework to Drive Growth

Overview

SACE provides employees and managers with specific time savings targets to be achieved with AI. SACE also issues guidance on how to use that saved time. This two-pronged approach creates an environment that orients employees toward activities that drive growth, not just efficiency.

Scenario

SACE operates in a document-driven industry that is being highly disrupted by AI. This presents an opportunity to use AI to both gain efficiencies and transform ways of working to drive SACE's current and future growth.

Solution highlights

- **Time save targets:** Give managers and employees targets and guidance to ensure AI technology is used to save significant blocks of time.
- **Smart time use guidance:** Share a framework for how time saved through AI use should be redeployed, to help employees redirect free time to business growth driving activities.

Gianfranco Chimirri

Chief People,
Culture and Agile
Organization Officer

About SACE

Industry: Banking, finance and insurance
Headquarters: Rome, Italy

Revenue: €1,9 bln (2024)
Employees: 950 (2024)

Guide Time Save and Spend to Drive Growth

SACE’s AI Time Save and Use Framework
Illustrative

Time save targets

Effectively leverage AI to save blocks of time.

Setting targets and offering guidance on how to use AI tools helps reduce time spent on low-impact, repetitive tasks.

Smart time use guidance

Redeploy saved time to growth-driving activities.

A framework with approved time-spend options helps employees determine how to redeploy saved time to growth-driving activities.

Source: Adapted from SACE

Set Targets to Maximize Time Saved Through AI

Time Save Targets Illustrative

Employees

Target: Save 20 hours per month

Reduce unproductive individual behaviors

Mandate

Reduce ineffective organizational behaviors

Managers

Providing sources of AI time-save guidance enables managers and employees to build personal judgment about how best to use new technology, helping them balance autonomy with accountability:

- Leverage peer insights on AI use
- Review organization's AI use cases
- Use AI-based analytics to find time waste
- Analyze employee insights on pain points
- Seek guidance from manager

Horizontal AI use case:

Benefits that each employee can have, irrespective of role or function.

Examples: Generating meeting summaries, building presentations, and reducing meeting inefficiencies.

Vertical AI use case:

Function-specific use cases that augment or automate within business processes.

Examples: Document review and completion of complex calculations (finance) and meeting preparation (sales).

Time Save and Use Framework Drives Impact

SACE's Results

Better use of technology and time

100%

AI adoption rate among workforce, with an average of 16 hours saved per month, per person

p 26%

Increase in productivity in 2024 and an additional 23% in 1H25

12.2%

SACE workforce redeployed from "run the business" to "grow the business" jobs

10%

Equivalent of SACE's workforce freed to do more valuable work

Source: Adapted from SACE

Stakeholder feedback

“As AI takes over more tasks, workers will be increasingly asked to invest in work that requires critical thinking, innovation, collaboration and meaningful human interaction. Creating space for those value-added activities — and offering workers autonomy in managing them — improves engagement with work and reduces job-related burnout.”

Gianfranco Chimirri, Chief People, Culture and Agile Organization Officer, SACE

Clifford Chance (Executive Alignment for AI Transformation)

Source: [Case Study: Executive Alignment for AI Transformation](#)

Building Enterprise Readiness for AI Disruption

Overview

Clifford Chance's CTO and executive peers take a comprehensive approach to evaluate and track AI's impact on their industry, business and people.

Scenario

Clifford Chance recognizes the disruptive potential of AI, especially generative AI (GenAI), for the legal industry. For example, while AI may bring productivity gains it can also lead to revenue disruption. To stay ahead, the firm's executive team developed an AI-infused strategy that considers how AI will affect their business and operating models.

Solution highlights

- **Help CxOs understand the impact of AI on the business model:** Facilitate continuous CxO conversations on how AI is reshaping the industry and enterprise, not just augmenting tasks.
- **Track the AI journey, not just outcomes:** Monitor leading indicators that provide insight into the progress and challenges of the enterprise's AI journey.
- **Scan and prepare for AI behavioral byproducts:** Evaluate AI's unintended consequences on employee behaviors and skills.

Due diligence agent

- ▼ Creative reasoning
- ▼ Analytical thinking

AI-Driven strategy partner

- ▲ Legal argumentation
- ▲ Litigation strategy building

Skills atrophy questions

- ☐ How important are these skills? Are we **okay to lose** them?
- ☐ Should we ensure **baseline skill proficiency** (e.g., conduct five AI-free negotiations)?
- ☐ Should we provide **alternative ways** to develop the skill? If yes, how?
- ☐ How does this skill loss **change existing roles**?

AI transformation
team

Executive
leaders

Managers and
champions

Experience compression questions

- ☐ Who would **benefit the most** from this experience compression?
- ☐ How does experience compression **impact our talent strategy** (e.g., compensation, career pathing)?
- ☐ Are there opportunities to **redirect time savings** from experience compression?
- ☐ How does experience compression **impact employee collaboration**?

The AI transformation team facilitates conversation to **decide on acceptable byproducts and potential mitigation steps.**

Early Results

Early Outcomes of Clifford Chance’s Efforts to Optimize Its AI Journey

Strengthened IT Position as a Strategic Partner

In our journey to harness the transformative power of AI, we've not only accelerated our firm's capabilities but also redefined the role of IT from a support function to a strategic enabler and trusted business partner.

Paul Greenwood, Chief Technology Officer

Enhanced Employee Satisfaction

Our empirical, employee-centric approach to AI implementation has resulted in a more engaged workforce that is enthusiastic about AI and reports greater job satisfaction.

Anthony Vigneron, Director, Legal Technology Solutions

Deep Dive: Organizational AI Readiness KPIs

Metric Definitions

Metric	What	Why	How
AI governance and leadership			
Establish and/or refresh responsible AI principles	A set of guidelines or frameworks to ensure that AI systems are designed, deployed and operated ethically and responsibly.	To build trust with stakeholders and mitigate risks associated with AI, such as bias, discrimination and privacy violations.	Principles published on company website or intranet, page views, adherence to a review cadence.
Staff trained on AI fundamentals	The percentage of employees who have received training on AI principles, basic concepts and applications of AI.	Essential for building a workforce that is knowledgeable and capable of leveraging AI technologies safely and securely.	Training completion rates, learning retention can be assessed through quizzes or assessments.
CxO participation in AI committees	The extent of CxO involvement in AI-related committees or governance bodies.	A marker of leadership commitment to AI initiatives; ensures alignment with strategic goals and facilitates resource allocation.	CxO attendance, quality and frequency of collaboration, depth of involvement in key decisions.
Portfolio of AI ecosystem partners	The strength and quality of strategic vendor/ peer partnerships to enhance products, services or processes leveraging AI.	Helps assess the enterprise's collaborative approach to leveraging AI for strategic growth.	Number of tech-enabled partnerships, revenue from AI partnerships as a percentage of total revenue.
Extent of business processes redesigned	The proportion of existing workflows, decision-making processes, or operational procedures modified to leverage AI gains.	Ensures that AI is not just an add-on but is integrated into the enterprise to add value.	Process mapping, analysis of AI-enhanced processes' outcomes, number of processes reimaged or eliminated because of AI.

Deep Dive: Organizational AI Readiness KPIs

Metric Definitions

Metric	What	Why	How
Workforce support			
AI beginners-to-regulars ratio	The ratio of employees who are new to using AI tools versus those who use them regularly.	Helps gauge the maturity of AI adoption within the workforce.	User engagement data to categorize employees based on the frequency of AI tool usage.
AI champions-to-users ratio	The number of employees available to coach colleagues on AI compared to those who are being guided or trained.	Tracks the extent of dissemination of AI awareness through peer-to-peer social learning.	User proficiency data and participating rates in formal mentorship programs.
Number of dedicated AI learning hours	The total number of employee hours spent on learning and training related to AI.	Assesses the organization's commitment to building AI skills and capabilities.	Time sheets (if available), data from LMS and self-reporting for formal training, skill badges earned.
Volume of Communities of Practice (CoP) participation	Level of participation in CoPs focused on AI topics within the organization.	Indicates a collaborative culture and a strong interest in AI knowledge sharing, innovation and continuous learning.	Attendance and engagement in CoP meetings, online forums (Teams, Slack channels) and events.
Number of trainings attended	The number of AI-related training sessions attended by employees.	Assesses the organization's commitment to building AI skills and capabilities.	Certifications obtained, attendance and completion rates for formal training sessions, workshops and online courses.
Managers trained to support employees using AI	The proportion of managers that completed training on supporting their employees using AI versus the total number of managers.	Ensures that strategic AI initiatives are effectively implemented at the operational level.	Participation in training programs and workshops, surveys to assess confidence in managing employees using AI.

Deep Dive: Employee AI Experience KPIs

Metric Definitions

Metric	What	Why	How
AI adoption measures			
Number of AI users	The total number of employees using AI tools within the organization.	Helps assess the reach and impact of AI initiatives and identify growth opportunities.	System access logs to track unique users.
Frequency of features used	Features used as a percentage of total features in a given AI tool.	Provides insight into which functionalities are most valuable, and which may require improvements or additional training.	Telemetry and system logs to track feature usage frequency and A/B testing to experiment with feature enhancements.
Frequency of AI use in daily work	The extent of AI tools being incorporated into employees' daily work activities.	Indicates successful integration of AI into employee workflows.	System logs to track frequency of accessing AI tools in a given time frame.
Employee AI trust			
Employee AI attitudes	Employees' perceptions, beliefs, and attitudes towards AI.	Helps identify potential resistance and areas where additional training or communication may be needed.	Employee surveys and focus group discussions.
% of non-AI users	The proportion of employees who do not use AI tools.	Helps understand barriers to adoption and develop targeted strategies to increase engagement.	AI usage data from system access logs segmented by demographics and role, employee surveys.

Source: Adapted from Clifford Chance

Deep Dive: Employee AI Experience KPIs

Metric Definitions

Metric	What	Why	How
Human/machine friction			
Tone of employee prompts	The language and sentiment used by employees when interacting with AI, particularly in text-based interfaces.	Provides insights into user sentiment, acceptance, and comfort level with AI systems.	Natural language processing (NLP) tools for sentiment analysis of user prompts.
Interaction abandonment	The frequency and circumstances under which users start but do not complete interactions with AI tools.	High abandonment rates can indicate usability issues, lack of perceived value or dissatisfaction with AI tools.	System logs to track incomplete interactions and identify patterns.
Repetition of prompts with minor variations	Frequency of employees repeating prompts with slight modifications.	Surfaces potential communication gaps between humans and AI.	System logs to track and categorize repeated prompts.

Source: Adapted from Clifford Chance

Deep Dive: Enterprise AI Brand KPIs

Metric Definitions

Metric	What	Why	How
Talent			
Number of external candidates attracted by AI value prop	An increase in AI-friendly candidates, i.e., people wanting to use the tech and open to	Indicates the strength of the employee value proposition (EVP) driven by AI.	Frequency of candidates stating AI posture as “reason to apply.”
Clients			
AI-related clauses in client contracts	The number of clauses in client contracts that specifically pertain to AI technologies or services.	Reflect the integration of AI into business offerings and client engagements.	Number and type of AI clauses, changes in the prevalence and nature of these clauses over time.
Competitors			
Market share for AI-infused products and services	The proportion of the total available market that is captured by the enterprise’s AI-driven products and services.	Reflects the organization's competitive position and success in leveraging AI to enhance its offerings.	Market sizing, sales data, industry benchmarks.
Industry			
Number of external accolades or trade press mentions	Recognition, awards or honors received for AI initiatives.	Signals AI thought leadership and innovation within the industry and professional communities.	Innovation awards won, trade press mentions and impressions, publications and citations.

Synopsys (Increase AI Impact Through Continuous Work Redesign)

Source: Adapted From Synopsys

Increase AI Impact Through Continuous Work Redesign

Overview

Achieving value from AI requires a fundamental restructuring of how work gets done, not just deploying AI tools onto existing workflows. To drive this transformation, Synopsys’ HR team is partnering with leaders and employees to continuously redesign work. By pinpointing precise automation and augmentation opportunities within daily workflows, HR is systematically reshaping roles and accelerating targeted upskilling efforts.

Solution Highlights

- **Analyze work data to map employee workflows at scale:** Synopsys feeds business and HR data (i.e., Jira, customer support tickets and jobs data) into a task intelligence platform to generate granular task lists and infer employee skills, allowing HR to understand workflows at scale without administrative friction.
- **Assess AI impact on employee tasks, not jobs:** To avoid wasting investment by overgeneralizing AI’s impact on work, Synopsys leverages a task intelligence platform to categorize tasks as fully automatable, augmentable by AI tools, or requiring human-only execution.
- **Involve employees in validating AI-driven changes to work:** To prevent operational complexity and change fatigue, Synopsys uses a dual-track approach to involve employees in work redesign. SMEs verify task automation potential and adjust workflows, while all employees independently verify AI-inferred skills within their learning platform.
- **Shape work redesign efforts using real-time data:** Synopsys plans to use task and skill data as a key input for workforce planning, supporting job redesign efforts (i.e., merging roles based on newly-automated workflows) and driving internal mobility efforts on an ongoing basis.

Scenario

Following significant business growth and improvements in AI innovations, Synopsys focused on improving its skills landscape and assessing opportunity areas for AI augmentation and automation. However, their existing job architecture lacked the granularity needed to understand daily work. To enable work redesign, HR leaders are implementing an AI strategy to continuously evaluate and redesign how work gets done across the business

About Synopsys

Industry:
Electronic design automation

Headquarters Location:
Sunnyvale, California, USA

Revenue:
\$7.05 billion USD (2025)

Employees:
28,000+ (2025)

Redesign Work Based on AI Impact

Synopsys' Continuous Work Redesign Journey

Analyze Work Data to Map Employee Workflows at Scale

Synopsys' Process for Inferring Employee Workflows With Task and Skill Intelligence*

Illustrative

1 HR and business leaders refine job descriptions and choose work data to input into a skill intelligence platform.

Using specific **work signals** over static job profiles ensures AI can capture a real-time, granular view of work.

2 HR leaders continuously add data to the skill intelligence platform to update AI-inferred task and skill profiles.

Task and skill analysis (illustrative)			
Raw work signal (input)	Inferred task	Inferred skill from task	Employee skill proficiency
 Jira ticket	Writing software validation scripts	AI-assisted code debugging	 Advanced

Inferring skill proficiency from task intelligence allows leaders to have **early visibility** into future skills needs.

Source: Adapted from Synopsys

* For more detail on vendor TechWolf's task and skill intelligence work with Synopsys, see the Appendix or Slide 15 in AI Use Case Library for HR.

** A labor market data lake is a centralized repository that continuously aggregates and stores large volumes of labor market data to provide real-time insights for strategic workforce planning and talent decisions.

Assess the Impact of AI on Employees' Tasks, Not Jobs

Synopsys' AI Impact Assessment

Illustrative: Sample AI Impact Assessment for Recruiters

Source: Adapted from Synopsys

* Skill intelligence platform vendor TechWolf uses the Stanford [Human Agency Scale](#) (HAS) to categorize tasks by their degree of human agency.

Involve Employees in Validating AI-Driven Changes to Work

Synopsys' Dual-Track Employee AI Analysis Approach

Illustrative: A case in point from Synopsys' talent acquisition function

Track 1: Manager-nominated SMEs validate needed workflow and process changes for their roles

Track 2: HR prompts all employees to verify and validate evolving skills needs

Accuracy: Do we agree with the AI's assessment?
Redundancy: Are we already trying to automate this specific process?
Practicality: Just because AI could do this task, should it?
Prioritization: Does this task address a high-pain problem?

SMEs' **proximity to how work gets done** allows them to **share targeted guidance** on facilitating changes to work.

Recruiter

Skills: + **Influencing**, candidate assessment, recruitment marketing, talent analytics, + **stakeholder management**, applicant tracking systems, negotiation, sourcing strategies

Programming proficiency:
● Medium

Recommended learning:
Navigating Stakeholder Management in Talent Acquisition

Employees **self-select** proficiency levels for each skill, which triggers personalized learning pathways to **prepare them for future changes to work.**

Future Plans: Iteratively Redesign Roles and Upskill Talent

Synopsys' Iterative Talent Plans (in-progress)

Illustrative: Redesigning and upskilling talent acquisition roles

Goal 1: Iteratively redesign roles

Synopsys plans to **iteratively redesign roles** once employee workflows become increasingly automated or augmented by AI due to work redesign efforts.

Goal 2: Drive continued upskilling

Synopsys is actively working to **continuously feed employee-validated skills** directly into their ATS to power internal job recommendations and upskilling opportunities.

The screenshot shows a web interface with a header 'My development opportunity recommendations:'. Below this, there is a light blue box containing a lightbulb icon and text: 'Based on your verified proficiency in Degreed and recent AI training completions, you are a 90% match for a **role** on the Core AI Project Team. Your validated 'Agent Creation' skills align with the requirements for the new AI Talent Operations Specialist role. **Apply here.**' Below this box, there is a red-bordered box containing text: 'To drive **employee comfort with AI tools**, employees who previously opted out of AI-driven skills data analysis will be made aware of peers who achieved growth opportunities by participating.'

Skills Management (Synopsis)

Synopsys 
Industry Electronic design automation
HR Function Talent management
AI Deployment Approach Hybrid
Vendor TechWolf

Source:: Adapted from Synopsys

Goal
Synopsys aimed to drive efficiency by identifying the automation or AI augmentation potential of employees' daily tasks. Leaders also hoped to leverage AI to help employees prepare for future roles and support career growth through targeted learning and job matching capabilities.
AI in HR Use Case
Synopsys is partnering with TechWolf to conduct a task and skill analysis. To ensure accurate output, the HR team first partnered with business stakeholders to adjust job descriptions and identify the top skills required for success. Leaders then used TechWolf to generate new job descriptions at scale. Synopsys now feeds TechWolf this information, along with various business and HR data sources based on employees' roles (such as Jira, customer support tickets, and Betterworks OKR data). TechWolf processes these signals and returns a comprehensive breakdown for every job: a list of tasks, the estimated amount of time each task takes, the predicted AI impact (automatable, augmentable, or human-only) and the specific skills needed. TechWolf also infers skill profiles, which employees can validate within Synopsys' LMS (Degreed) to receive tailored learning recommendations. Synopsys is actively working to feed this skills data into its ATS (Avature) to determine job recommendations and into their performance management platform (Betterworks) to provide visibility into skills for performance conversations.
Results
The analysis of HR roles found that 60% of Shared Services tasks had automation or augmentation potential. This finding enabled HR to identify the most tangible, high-ROI workflow improvements and present a clear strategy for which tasks could be supported by AI, and the investment needed to achieve that. HR leaders are transitioning higher-value work from other parts of HR to the Shared Services team while also identifying workflow improvements due to AI for other HR roles (e.g., Recruitment).
