

AI Use Case Library for HR

Introduction

These use case examples showcase how leading organizations are successfully leveraging AI in and across HR functional areas.

HR leaders can use this presentation to:

- 1 Get inspired by use case examples from HR organizations
- 2 Gain visibility into possible use cases to pursue with AI
- 3 Gauge potential benefits to achieve from implementing AI

Methodology:

Use case examples were sourced from extensive interviews with HR leaders in a variety of functional areas. Use cases were also obtained from publicly available vendor and organizational data on HR AI applications.

HR Function and Operations

GenAI HR Virtual Assistant (Mercado Libre)

Mercado Libre 	Goal Mercado Libre wanted to enhance the user experience and reduce costs by automating as many employee queries and transactions as possible. The company converted its rule-based HR bot into a conversational GenAI virtual assistant capable of handling more employee questions autonomously.
Industry Technology	AI in HR Use Case Mercado Libre developed a conversational GenAI virtual assistant called People Chat to facilitate employee self-service of nearly all HR queries and transactions. People Chat is integrated into Google Chat, which is the company’s daily work environment, communication and collaboration tool. As opposed to the rule-based bot that required several clicks for employees to achieve results, People Chat allows employees to leverage iterative, conversational GenAI that resolves their query successfully 95% of the time. This success is due to the rigor Mercado Libre put into the delivery. The company spent four months training People Chat for accuracy, building an architecture that correctly identifies employee needs. Mercado Libre also piloted People Chat with 10,000 employees to improve its answers before a companywide rollout five months later.
HR Function HR operations	
AI Deployment Approach Native	
Vendor In-House development	Results People Chat GenAI resolves 95% of questions, assisting with approximately 1.4 million employee queries and generating \$2.7 million in savings.

GenAI Total Rewards Virtual Assistant (Moderna)

Moderna 
Industry Biotechnology
HR Function HR operations; total rewards
AI Deployment Approach Embedded
Vendor OpenAI (ChatGPT Enterprise)

Goal
Moderna aimed to streamline and improve employee access to total rewards information — including performance reviews, benefits, equity compensation and job leveling — while reducing HR teams’ workloads. HR leaders recognized that manually answering employee questions was no longer sustainable, making AI-powered solutions a necessity to improve efficiency and employee experience.
AI in HR Use Case
Moderna partnered with OpenAI (ChatGPT Enterprise) to create custom "GPTs" tailored for HR functions including: • The most popular example is a “self-review GPT” summarizing employees’ year-end performance reviews. • A "U.S. benefits GPT," which helps employees assess and select benefits like healthcare. • The "equity GPT," which assists employees with questions they have for the HR team about their equity program (it gives employees a complex choice between stock options or restricted stock units). • An HR-facing "job leveling GPT" that helps determine where new roles should fall within the organization’s job architecture, providing confidence scores to guide hiring decisions — especially in high-impact fields like oncology. These "GPTs" handle 80% of inquiries related to the HR area they cover.
Results
The use of ChatGPT Enterprise significantly reduced the volume of HR service tickets and emails, which improved operational efficiency. The Moderna "GPTs" have also helped to drive employee engagement; within two months of ChatGPT adoption, employees averaged 120 GPT conversations per week.

| Talent Management |

Succession Planning (Siemens Healthineers)

Company 	Goal Following its acquisition of Varian Medical Systems, Siemens Healthineers had two separate HR systems, which made it difficult for leaders to obtain talent data and identify successors from across the organization. HR leaders needed a scalable way to increase talent movement and strengthen succession planning by automating manual processes.
Industry Medical technology	AI in HR Use Case Siemens Healthineers implemented Phenom’s AI-enabled succession planning software. Phenom unified employee profiles in one system, allowing leaders to see potential successors for key roles, full chains of succession, and high performers’ tenure in key roles. The platform’s configurable interface gives managers visibility into readiness indicators and development opportunities tailored to specific functions, such as technical skills and certifications for engineering teams or creative competencies and campaign experiences for marketing roles. The AI functionality within Phenom’s platform compares role needs with self-reported and AI-inferred employee skills, peer endorsements and experience data to surface potential successors, including those that could be strong fits for future roles if they gained additional skills. The system also highlights patterns, such as individuals appearing in multiple succession plans, which help leaders have strategic conversations about talent readiness and development.
HR Function Talent management	Results The platform unified over 70,000 employee profiles, created potential ratings for 30,000 employees and built 15,000 active succession plans across the organization. These efficiencies enabled Siemens Healthineers to conduct over 300 talent reviews in the past year, while reducing manual effort.
AI Deployment Approach Cloud	
Vendor Phenom

Employee Engagement Action Plans (MacLean-Fogg)

Company 	Goal Across MacLean-Fogg, HR leaders wanted to make employee feedback more accessible to frontline managers. While managers were eager to support their employees, they often lacked real-time access to feedback and struggled to respond effectively without HR guidance.
Industry Manufacturing	AI in HR Use Case To support managers, MacLean-Fogg adopted Quantum Workplace. Through the platform, managers can access teams' engagement survey results at any time, regardless of employees' shift or location, which removes delays arising from HR needing to interpret and share the data. Quantum provides AI-powered insights that help managers interpret survey responses and identify next-step actions. For example, AI suggestions may encourage managers of employees who struggle with having the information needed to do their jobs well to hold regular communication sessions and connect employees with other experts who can answer questions. This guidance enables managers to act confidently, whether addressing employees' concerns, recognizing their teams, or taking visible action based on feedback.
HR Function Talent management	Results Engagement survey action planning shifted from a top-down HR process to a collaborative, manager-owned approach. Additionally, employee survey response rates increased from 70% to 80% year-over-year, while managers became more proactive and confident in addressing feedback. Managers also reported higher visibility into key engagement drivers and improvement areas.
AI Deployment Approach Cloud	
Vendor Quantum Workplace

AI-Driven Customized Career Plans (Pinnacol Assurance)

Pinnacol Assurance 	Goal Pinnacol Assurance wanted to use AI to build efficient, customized career development plans for employees, shortening a time-intensive process, while making it more impactful for employees.
Industry Insurance	AI in HR Use Case Pinnacol has leveraged AI functionality to review, analyze and more transparently define career paths. Using historical data, job description repositories, development resource libraries and employees' interests and existing experiences, Pinnacol employs NotebookLM to create personalized development plans with specific action items. Through this intentional, AI-driven plan, Pinnacol quickly identifies aligned skill and experiential learning opportunities that address the competencies employees need to grow into their desired roles. HR staff and employee managers support employees by walking them through the AI-generated career pathing and development plan process to ensure targeted growth and make any necessary tweaks. Pinnacol is piloting making this tool freely accessible to all staff in the near future.
HR Function Talent management	
AI Deployment Approach Embedded	
Vendor Google Suite (Notebook LM and Gemini)	Results Through AI efficiencies, Pinnacol has automated career development processes that previously took months to create.

Source: Adapted from Pinnacol Assurance

AI-Assisted Performance Management (Pinnacol Assurance)

Pinnacol Assurance PINNACOL ASSURANCE	Goal
Industry Insurance	Pinnacol wanted to use AI to standardize performance management processes to ensure that managers use the same criteria to evaluate employees.
HR Function Talent management	AI in HR Use Case
AI Deployment Approach Embedded	Pinnacol used AI to standardize its performance management process. After consulting key leaders across the organization, Pinnacol identified consistent metrics, objectives, and KPIs, which it paired with organizationwide performance criteria to create standard performance management processes. The consistent process ensures managers give the same rating for the same data points across the organization. To use the AI, managers upload relevant reports into NotebookLM, which aligns manager-inputted metrics against centralized objectives, KPIs and rubrics stored in NotebookLM, ensuring equitable benchmarking across the organization. The AI develops an objective appraisal of the team member based on this data, but the manager retains final ownership of writing the performance reviews.
Vendor Google Suite (Notebook LM and Gemini)	Results
	Both employees and managers have responded positively to the new AI-assisted performance management details, with employees reporting that performance expectations are clearer.

Source: Adapted from Pinnacol Assurance

Strategic Workforce Planning (HSBC)

HSBC  HSBC	Goal HSBC aimed to replace fragmented talent data with unified skills intelligence to power strategic workforce planning. As the bank shifted toward a tech-driven, engineering led organization, leaders needed clear visibility into existing and emerging skills across a global population of approximately 250,000 employees.
Industry Banking	AI in HR Use Case HSBC partnered with vendor TechWolf to build an AI-driven skills intelligence system. The platform uses LLMs to automatically infer skills from multiple employee data sources, including HR systems, Jira, GitHub, Bitbucket and artifacts such as emails and internal documents. During the proof-of-concept phase, HSBC and TechWolf iteratively tuned the models until they could infer 80% of employee skills automatically, which reduced manual effort and maintenance. TechWolf then deployed an AI-generated taxonomy that consolidated 4,000-5,000 skills into roughly 300 skills packages aligned to HSBC's job architecture. The system serves as a data provider, feeding skills insights into HSBC's workforce planning platforms, as well as learning and talent acquisition systems. The system now supports a talent marketplace, digital badging and on-the-job development opportunities across the bank.
HR Function Talent management	Results In 2024, HSBC powered its strategic workforce planning by unlocking over 250,000 hours of skills development and enabled over 46,000 employees to create skill profiles for matching with projects and networking opportunities. The bank launched over 150 digital badges and issued over 12,000 credentials associated with priority skills, while skills inference provided visibility into over 2,500 distinct roles.
AI Deployment Approach Phased	
Vendor TechWolf	

Source: [HSBC: How to Build Skills Intelligence Across 250,000 Employees](#)

Strategic Workforce Planning (Merck KGaA)

Merck KGaA 	Goal Merck KGaA realized that traditional headcount-based workforce planning was insufficient and shifted toward an approach that integrated workforce capacity, skills and cost planning. This pivot reflected the company's view that skills — not just roles — must anchor strategic workforce decisions.
Industry Banking	AI in HR Use Case To reach their new goals, Merck KGaA migrated all skills-based capabilities to Phenom, creating a harmonized skills layer across its existing HR, workforce planning and financial systems. Rather than simply replacing these platforms, Phenom served as a “single source of truth” for skills data, giving HR leaders consistent visibility into employee capabilities across the entire talent value chain. Within this architecture, Phenom's AI analyzes workforce data to identify skills that are missing, declining or rising in importance, informing targeted L&D initiatives. Phenom runs short- and medium-term workforce planning scenarios, helping leaders understand how business strategies will affect skills needs. Scenarios inform HR leaders where reskilling, upskilling or redeployment learning paths are needed, eliminating the need for ad hoc training investments.
HR Function Talent management	
AI Deployment Approach Phased	
Vendor Phenom	Results Since its launch, over 36,000 employees have used the platform. Merck KGaA has collected over 200,000 skills, centralized more than 29,000 learning opportunities and enabled over 1,000 active mentorships. Additionally, with unified skills data, leaders have a clearer view of which employees can be upskilled or redeployed into new roles, reducing reliance on external hiring.

Source: [Mastering Workforce Dynamics: Merck KGaA Germany's Cutting-Edge Approach](#)

Skills Management and Labor Market Intelligence (Dr. Reddy's Laboratories)

Dr. Reddy's Laboratories	Goal
Dr.Reddy's 	Dr. Reddy's Laboratories sought to move away from manual skills audits toward dynamic skills mapping that could support a scalable, skills-based operating model. Leaders recognized that manual skills mapping, often taking two to four hours per role, was too slow and static to guide modern workforce strategy.
Industry Pharmaceuticals	AI in HR Use Case
HR Function Talent management	The company adopted Lightcast's AI-enabled Talent Transform platform, which included Skills Agent, a new automation capability. Skills Agent continuously updates skills-to-job associations, replacing manual mapping and eliminating the resource-intensive processes that previously prevented skills initiatives from scaling. The tool proactively detects shifts in the labor market, internal roles and business priorities, automatically recommending relevant skills to enrich employee profiles. Talent Transform is built on Lightcast's proprietary taxonomy of over 73,000 occupations and 34,000 validated skills, integrating external labor market intelligence to benchmark Dr. Reddy's internal data against emerging trends. This data enables responsive workforce planning and provides clarity on rising, declining and missing skills, which informs reskilling and upskilling strategies.
AI Deployment Approach Cloud	Results
Vendor Lightcast (Talent Transform)	Dr. Reddy's Global L&D Leader reports that Talent Transform provided the structure, clarity and market intelligence needed to govern skills effectively and keep talent data current. The platform has been a "game-changer" for driving a more skills-based approach at scale across the organization.

Source: [Lightcast Launches Skills Agent: Automating Skills-to-Job Alignment](#)

Talent Acquisition (Recruiting)

Interview Summarization and Evaluation (ARAUCO)

Company 	Goal HR leaders at ARAUCO have created goals to experiment with AI to identify quick wins for their teams. They considered features that could automate routine or repetitive tasks to free up time for more strategic and productive work. The recruiting team had a goal to streamline activities within the interview process.
Industry Manufacturing	AI in HR Use Case HR leaders at ARAUCO gave functional leaders the freedom to explore and pilot new AI tools, even those outside of HR. Recruitment leaders decided to utilize diio, an AI-powered sales assistant that helps sales teams automate tasks, analyze conversations and improve performance.
HR Function Recruiting	HR leaders thought that diio features could be applied to the interview process as well. By inviting the tool into the interview session, it could act as a real-time interview partner. ARAUCO found that diio could review candidate profiles to suggest appropriate interview questions and remind interviewers not to forget anything critical during the conversation. Following the interview, the tool automatically summarized the interview and provided candidate insights for the recruiting team to review. Collection of interview feedback is often a struggle. These summaries provided the hiring team with a way to have more meaningful dialogue around the interviewed candidates best suited for the role.
AI Deployment Approach Hybrid	
Vendor diio	Results Interviewers viewed the tool as a "nice augmentation" and a "real-time partner" that helped them perform better. The tool enjoyed high adoption, boosting confidence among recruiting staff and hiring managers, and making them “feel empowered to experiment with AI tools to make their work more efficient.”

AI Interview Scheduling (The Campbell's Company)

Company 	Goal After bringing the recruitment function in-house three years ago, Campbell's was focused on automation and operational efficiency, seeking to improve the candidate experience. As part of this effort, the company targeted interview scheduling, a highly manual, time-consuming process distributed across multiple teams.
Industry Packaged food and beverage	AI in HR Use Case Campbell's engaged with Paradox for its career site, virtual recruiting assistant and interview scheduling capabilities. The company named its assistant "Cam." In September 2025, Cam started scheduling recruiter phone screens. By the end of October, Campbell's began leveraging Cam for the broader interviewer population as well. Cam integrates with Outlook calendars and Teams for video interviews; the solution presents candidates with interview date/time options and sends all participants detailed calendar invites once the candidate selects the date/time option. For the candidate, Cam is also present on the Campbell's career site to answer common questions, recommend relevant roles and invite candidates to join the Campbell's talent community if no role matches exist. To ensure success, Campbell's built a comprehensive change strategy, including enablement sessions with hiring managers to introduce the solution and discuss required behavioral changes and best practices regarding calendaring.
HR Function Recruiting	Results Deploying Cam reduced Campbell's' median time-to-schedule (TTS) from 5 days to 32 minutes (note: TTS can take up to two hours for more complex interview requests, still demonstrating significant improvement). These efficiency gains have allowed recruiters, coordinators and HRBPs to refocus on candidate care and higher-value interactions. Conversion rates (visit-to-apply) on the Campbell's career site improved from 20% to 48%.
AI Deployment Approach Embedded	
Vendor Paradox

AI Assistant in High-Volume Hiring (Chipotle)

Chipotle	Challenge
	Chipotle needed to accelerate high-volume hiring across 3,800 restaurants to lift the burden off General Managers (GMs), who act as both hiring managers and recruiters and are responsible for staffing Crew Members in their restaurants. The application process was time-consuming, and time-to-hire averaged 12 days, creating staffing challenges amid high turnover.
Industry	AI in HR Use Case
Retail	Chipotle implemented Paradox’s AI assistant, which they named “Ava Cado,” to streamline high-volume hiring. The solution introduced a mobile-friendly, chat-to-apply process that reduced friction for applicants and automated tasks such as eligibility screening and interview scheduling.
HR Function	The deployment followed a phased approach, starting with pilot locations and gradually expanding nationwide. To reduce risk, Chipotle only leverages AI in candidate screening and interview scheduling. Chipotle now plans to create “realistic job previews” for better alignment between candidate expectations and job requirements through opt-in questions and job experience simulations.
Recruiting	
AI Deployment Approach	Results
Embedded	Chipotle’s AI assistant led to a reduction in time to complete applications from ~3 days to 8 minutes and a decrease in application to apron (start date) to 3.8 days (down from ~11 days). The AI assistant delivers a high-volume hiring competitive advantage, improves the candidate experience, and allows general managers to focus on running their restaurants rather than administrative hiring tasks.
Vendor	
Paradox

Candidate Matching (Vanderlande)

Company	Goal
<u>VANDERLANDE</u>	Recruiters at Vanderlande aimed to increase hiring efficiency and speed while improving the quality of candidate matching, particularly for its high volume of candidates in hard-to-fill roles.
Industry	AI in HR Use Case
Logistics services	Vanderlande integrated HiredScore into its existing Workday HCM system to facilitate candidate matching at scale. HiredScore’s AI analyzes resumes and applicant profiles to extract skills, experiences, and qualifications, going beyond traditional keyword matching to assess role relevance. The system evaluates candidate fit in real time, ranking applicants based on how closely their profiles align with job requirements and highlighting those most likely to succeed, along with providing a summary of the matching results for recruiters to affirm. This capability is particularly valuable for experienced positions that garner a high volume of applicants. For hard-to-fill roles, Vanderlande also uses HiredScore’s Fetch functionality to rediscover past applicants in its existing database and identify qualified candidates it might otherwise overlook. Recruiters receive ranked recommendations that reduce manual effort and ensure their focus is placed on the strongest candidates.
HR Function	Results
Recruiting	Screening time for high-volume roles decreased by 50% and hard-to-fill positions were staffed faster. Recruiters observed that candidates ranked highest by the AI were typically those hired, reinforcing confidence in the matching model. Vanderlande plans to expand HiredScore’s use to support internal mobility in the future.
AI Deployment Approach

Candidate Matching (Siemens)

Siemens SIEMENS	Goal HR leaders at Siemens wanted to simplify and optimize the recruiting experience by enabling skills-based role matching that aligns candidates with best-fit roles while reducing manual workload for recruiters. This shift reflected the organization’s goal to improve matching accuracy through AI-driven processes.
Industry Technology	AI in HR Use Case Siemens deployed Eightfold’s AI platform through a partnership between its People & Organization and Global Business Services Hire-to-Retire teams, using it to power skills-based matching. Eightfold’s model automatically translates resume content into skills, considering related skills rather than relying on fixed keywords. The model’s translations allow for more accurate and inclusive matching. After uploading a resume, the system evaluates the candidate's skills against all open roles, not just the one the candidate applied for, and continuously suggests new opportunities that fit the candidate’s profile. To boost inclusion, the platform also provides recruiters with datapoints and suggested adjustments to job descriptions to better attract qualified candidates, especially for hard-to-fill roles. Together, these capabilities reduce manual screening time and deliver a more efficient process for both candidates and hiring teams.
HR Function Recruiting	Results Siemens leverages Eightfold to match over three million applications per year. The company has significantly reduced manual recruiter workload by automatically matching candidates to roles. To further drive efficiency and support employee growth, Siemens plans to extend AI-based skill matching to internal candidates.
AI Deployment Approach Hybrid	
Vendor Eightfold AI	

Source: [Siemens](#)

Virtual Assistant Apply (General Motors)

Company 	Goal General Motors (GM) needed to scale recruiting operations to handle high candidate volumes of one to two million applicants per year. Despite contracting more than 55 recruiting coordinators, interview scheduling still took five to seven days, creating delays that threatened hiring speed and candidate experience.
Industry Automotive	AI in HR Use Case In November 2021, GM launched EV-e, a conversational AI recruiting assistant designed to automate candidate engagement and interview scheduling at scale. EV-e engages candidates with 24/7 support and scheduling assistance through their preferred communication channel, including GM’s career site, SMS, email and WhatsApp. The career site assistant also answers candidate questions about GM’s roles, culture and teams, and recommends relevant roles — even before candidates formally apply. EV-e integrates directly with Workday, creating candidate profiles in real time and automatically inviting qualified applicants to schedule interviews based on recruiter availability. Candidates can also independently select or change interview times, ensuring continuous communication and reducing friction.
HR Function Recruiting	Results GM reduced time-to-schedule from over five days to just 29 minutes — a 99.6% decrease — and has scheduled more than 74,000 interviews using EV-e. GM also reports that hiring automation has generated approximately \$2 million in annual cost savings, while greatly improving candidate engagement and hiring velocity.
AI Deployment Approach Embedded	
Vendor Paradox (Workday)	

Source: [Paradox](#)

Virtual Assistant Apply and Scheduling (Tao Group Hospitality)

Tao Group Hospitality	Goal
	Tao Group Hospitality aimed to reduce time to hire and cost per hire without sacrificing candidate quality. Its goal was to give time back to hiring managers by streamlining the top-of-the-funnel screening and scheduling tasks associated with the organization’s high-volume positions.
Industry	AI in HR Use Case
Retail	Tao Group Hospitality partnered with LANDED to implement a conversational AI platform to automate candidate screening, application and interview scheduling for high-volume roles. LANDED improved candidate quality through the conversational AI screening feature, which assessed candidate availability and qualifications through SMS text.
HR Function	Leveraging this personalized applicant engagement model allowed Tao Group Hospitality to effectively screen and schedule interviews for qualified applicants before engaging hiring managers to complete qualifying interviews and offer activities.
Recruiting	
AI Deployment Approach	Results
Embedded	Since implementing the platform, Tao Group Hospitality has reduced time to interview to less than 24 hours, sourced 2,800 qualified applicants and auto-scheduled 383 interviews per month, saving 1,000 hours for hiring managers each month.
Vendor	
LANDED	

Source: [LANDED](#)

AI-Enabled Candidate Sourcing (Abano Healthcare)

Abano Healthcare 	Goal Abano Healthcare faced complex sourcing challenges across international markets, particularly for hard-to-fill clinical roles in rural and regional locations. Manual, fragmented recruiting processes needed adjustment to source qualified talent at the speed required for a geographically dispersed healthcare network.
Industry Healthcare	AI in HR Use Case To support an always-on, AI-enabled sourcing model, Abano partnered with Leoforce to automate the identification, prescreening and engagement of clinical candidates across global markets and time zones. Leoforce’s Applicants on Demand solution continuously sources talent from job posting channels, runs targeted outreach campaigns and engages candidates until they are ready to apply. Using AI targeting and curation, Leoforce replaces low-yield email blasts with tailored campaigns that surface candidates more likely to apply. Once engaged, qualified applicants are directly delivered into SmartRecruiters, which serves as Abano’s ATS. Platform integration allows recruiters to quickly transition from sourcing to selection, while benefitting from SmartRecruiters’ built-in scheduling and tracking capabilities..
HR Function Recruiting	
AI Deployment Approach Hybrid	
Vendor Leoforce; SmartRecruiters	Results AI-enabled sourcing reduced time-to-interview for international candidates from two to three weeks to within one week of application. Additionally, targeted outreach campaigns increased candidate email response rates from 5% to 83.87%.

Source: [How Abano Healthcare Transformed Talent Acquisition With SmartRecruiters and Leoforce](#), 2025

AI-Powered Candidate Assessments (Capgemini)

Capgemini	Goal
	Recruiters at Capgemini's France office struggled to manage manual candidate screening steps, technical interviews and disconnected tools. With up to 90,000 hires annually and early-career pipelines filled with unqualified applicants, HR leaders needed a solution that could streamline screening without negatively impacting candidate experience.
Industry	AI in HR Use Case
IT services	HR leaders partnered with Maki People to replace manual screening steps with automated assessments. Maki People introduced a two-phase assessment approach to evaluate both hard and soft skills:
HR Function	• In Phase 1, candidates complete a short, 15-minute skills overview assessment, which evaluates technical knowledge, language proficiency and core competencies, serving as an automated alternative to initial screening interviews. • Candidates who advance to Phase 2 complete a deeper, role-specific assessment aligned to competency frameworks designed for each line of business. Candidates receive immediate feedback on strengths and skill gaps, while recruiters and managers gain insights that help them to be more targeted as they prepare for the interview stage.
Recruiting	Through Maki's configurable conversational AI platform, assessments integrate into Capgemini's recruiting flow, with results calculated in real time and fed directly into the ATS.
AI Deployment Approach	Results
Embedded	The platform reduced early-career hiring timelines in France from several weeks to 10 days or less, while maintaining high quality of hire. Additionally, 96% of candidates completed assessments, and 95% reported satisfaction. Capgemini plans to expand assessments to additional markets in 2026.
Vendor	
Maki People

RESTRICTED

Voice AI Interviews (Elara Caring)

Company	Goal
	Elara Caring needed to scale hiring while eliminating gaps between candidate volume and recruiter capacity. With 7,000–10,000 applicants per month, many applying outside business hours, recruiter-led phone screenings were limiting speed and making real-time engagement nearly impossible.
Industry	AI in HR Use Case
Healthcare	As part of a phased AI recruiting strategy, Elara Caring deployed a conversational AI voice agent built with Phenom to handle initial candidate screenings. The agent, Emma, sits at the top of the hiring funnel and invites qualified candidates to complete a phone screening immediately after applying. Available 24/7, Emma allows candidates to complete or reschedule screenings anytime, matching the nontraditional schedules of frontline caregivers, many of whom apply on evenings or weekends. The voice agent conducts structured screening conversations, including background questions, state-specific compliance checks, and behavioral and situational interview questions, while maintaining a consistent and professional tone.
HR Function	After each call, Emma applies a scoring rubric based on Elara-defined criteria, with human recruiters reviewing all results and making final decisions. This human-in-the-loop design enables recruiters to focus on high-value conversations while the AI absorbs screening volume and eliminates coverage gaps.
Recruiting	Results
AI Deployment Approach	Using Emma reduced the time from application to accepted offer to 2.3 days, with 92% of interviews completed within one day and 41% within a single hour. Recruiters saw 40% increase in completed screenings and a 21% increase in hire volume, efficiencies that freed time for them to focus on follow-up conversations.
Phased	
Vendor	
Phenom

Voice AI Interviews (Hollstadt Consulting)

Company 	Challenge Hollstadt experienced a significant surge in candidate applications across its client portfolio, overwhelming the recruiting team. Recruiters' reliance on manual resume screening processes not only increased time to hire but also risked overlooking high-quality talent due to inefficiencies.
Industry IT services	AI in HR Use Case Hollstadt Consulting partnered with Sense to implement its Voice AI platform, internally branded as "Sunny," to automate the company's initial first-round screening process. After a candidate applies, the platform automatically initiates an AI-led interview using a customized set of screening questions. Recruiters receive a detailed transcript and summary results, allowing them to quickly sift for the most qualified individuals without reviewing thousands of profiles. Sunny offers three key features that allow for a seamless candidate experience: 1) automated initiation of a branded, AI-led voice screening to engage the candidate post application; 2) around-the-clock availability, allowing candidates to complete the screening on their own schedule; and 3) flexible call-back functionality.
HR Function Recruiting	Results Hollstadt's AI-led interviews eliminated 754 hours of manual resume review and phone-screen work within 90 days. Sunny is scalable, screening 1,200 applicants in just two days. Hollstadt experienced a candidate completion rate of 74% and candidates provided an 82% positive sentiment score. Every applicant receives personalized feedback, eliminating the traditional "black hole" of recruitment.
AI Deployment Approach Embedded

Learning and Development (L&D)

Adaptive Learning (STADA)

Company 
Industry Pharmaceuticals
HR Function L&D
AI Deployment Approach Phased
Vendor Area9 Lyceum

Goal
STADA aimed to deliver effective training for a new SAP ordering system and billing tool. Previous one-size-fits-all training methods were insufficient for an employee population with varying levels of prior knowledge about the technology. These approaches led to learner frustration and a high volume of support requests.
AI in HR Use Case
STADA implemented the Area9 Rhapsode adaptive learning platform and developed five learning modules in collaboration with Area9 partners. HR and IT leaders piloted the platform with a test group of 70 employees, who informed iterative technical and content adjustments prior to companywide deployment. The platform integrated into STADA’s LMS (SAP SuccessFactors) to deliver personalized learning journeys that adapt to each learner’s experience level and pace. Area9’s AI selects the most relevant content based on a learner’s prior knowledge, scores and time to complete prior modules, enabling experienced users to progress quickly while less experienced employees receive additional guidance. To minimize knowledge gaps, Area9’s platform generates automated, personalized refresher modules upon course completion, which focus on the most difficult learning objectives.
Results
Learners achieved 100% competence across predefined learning objectives, an increase from 53.3% competence prior to training completion. Support inquiries declined significantly, relieving pressure on HR teams and improving overall employee productivity.

Personalized Learning (BT Group)

Company
BT Group
Industry
Telecommunications
HR Function
L&D
AI Deployment Approach
Hybrid
Vendor
Degreed

Goal
As BT Group transformed from a traditional telecommunications provider into a modern, tech-enabled enterprise, L&D leaders recognized the need to quickly build critical skills across the organization at scale.
AI in HR Use Case
L&D leaders began the transformation by creating a skills taxonomy mapped to 600 core roles. In 2024, using Degreed’s Automations tool, the company rolled out an AI-enhanced learning experience platform called My Campus. The platform leverages AI to aggregate content from providers such as Pluralsight, Coursera and LinkedIn Learning, alongside proprietary BT Group materials, to deliver personalized recommendations based on employees’ roles, preferences and behavior. The Automations tool further personalizes learning journeys by automatically delivering content through nudges and tailored learning journeys for each business unit, eliminating manual training assignments.
My Campus integrates with SuccessFactors to share skills data in a single system of record. Employees can also access learning content within Microsoft Teams, which helps to increase adoption.
Results
Since its global launch, 74% of employees have connected to the My Campus platform at least once and 63% have declared over 10 skill interests. The platform has also boosted learning engagement, with Coursera enrollments increasing by 31% and unique learners increasing by 16% year-over-year.

Personalized Learning (United Airlines)

Company UNITED	Goal United Airlines faced the challenge of reskilling employees to keep up with new technologies and changing job requirements, while meeting compliance and regulatory requirements. Following the addition of nearly 20,000 employees to manage post-COVID-19 travel demand, the company sought to modernize its training infrastructure to support continuous learning at scale.
Industry Transportation	AI in HR Use Case United Airlines implemented Cornerstone’s LMS and learning experience platform (LXP); the latter leverages AI to deliver scalable, personalized training across the enterprise. A key component of this transformation was the launch of United’s Leadership Institute, which uses Cornerstone's virtual reality simulations and AI-driven personalized learning modules to prepare new leaders for the complexities of aviation operations. These solutions tailor development experiences to distinct roles, from pilots to airport operations staff, improving skill retention and real-world readiness.
HR Function L&D	The platform integrates with United’s existing systems through robust data synchronization, ensuring accurate tracking of learning histories and content access. Together, these capabilities enable United to balance role-specific training and compliance requirements within a unified learning ecosystem.
AI Deployment Approach Hybrid	Results The platform supports over 5 million training activities annually and has significantly reduced the time required for onboarding and continuous training. AI-driven personalization has improved employee engagement while maintaining compliance with regulatory requirements.

Internal Talent Marketplace (Pernod Ricard)

Company 	Goal Pernod Ricard recognized that employees often struggle to identify the skills needed to achieve their short- and long-term career goals. To address this issue, leaders sought to leverage AI to provide visibility into required skills and clarify the link between skill sets and potential career opportunities.
Industry Food and beverage manufacturing	AI in HR Use Case In September 2024, Pernod Ricard launched Horizons, a global AI-powered talent marketplace designed to advance skills-based development. The platform uses AI-driven personalization to match employees' current skills and skill interests with tailored opportunities, including mentorship, learning programs, short-term projects (“gigs”), and open roles. Horizons empowers employees to take ownership of their career journeys by leveraging existing capabilities while developing new ones, creating flexible and individualized paths. At the heart of the platform is the Career Hub, which dynamically recommends opportunities based on professional and personal skills, career history and job profiles. Employees can participate in short-term projects to gain diverse experiences and strengthen or acquire new skills. By framing development through a skills lens, Horizons makes growth opportunities more visible and transparent across the organization, ensuring that employees have equal access to them.
HR Function L&D	
AI Deployment Approach Hybrid	
Vendor Workday	Results Since its global launch, 74% of employees have connected to Horizons at least once; 63% have declared over 10 skill interests; 92 completed gigs; and 171 have engaged in ongoing peer-to-peer collaborations. The platform also boosted learning engagement, with Coursera enrollments increasing by 31% and unique learners increasing by 16% year-over-year.

Vendor
Gloat

Goal
Schneider Electric identified that internal talent lacked visibility into available short-term projects, open roles and mentorship roles. In addition, internal surveys revealed that nearly half of departing employees cited a lack of internal growth opportunities as a reason for leaving. Leaders aimed to leverage AI to solve these challenges by creating wider access to opportunities.
AI in HR Use Case
Schneider Electric launched the Open Talent Market (OTM), an AI-powered internal talent marketplace. OTM matches employees’ skills and aspirations with available roles, projects and mentors globally — accelerating opportunity matches and internal networking connections. The platform integrates with Schneider’s 3E learning model — experience, exposure and education — enabling employees to devote 10–15% of their time to projects outside their current role. Significant policy changes supported this model, including the elimination of “time in position” requirements and the removal of the need for manager approval before applying to new roles. Employees receive feedback on all submissions and managers gain visibility into internal talent for open projects and positions. By leveraging AI, the company’s OTM solution surfaces candidates managers might otherwise overlook.
Results
By the end of 2024, over 95% of employees were active on OTM, generating more than 40,000 digital development opportunities. The platform facilitated visibility to 15,000 open positions, 4,000 mentorships and 2,000 internal gig projects, with an average of 23,000 monthly visits by employees.

Internal Talent Marketplace (Standard Chartered)

Company 	Goal Standard Chartered aimed to build skills that could keep pace with industry changes — in areas such as sustainability, innovation, data, digital, and leadership — while ensuring employees could also develop role-specific capabilities. A multiyear skills analysis also revealed that significant job disruption was likely, with older roles disappearing and new roles emerging in areas like AI governance, prompt engineering and ethics.
Industry Banking	AI in HR Use Case Standard Chartered introduced “skills passports” through Gloat, its AI-enabled internal talent marketplace (ITM), allowing employees to join cross-functional and cross-location projects, connect with mentors and explore roles based on skill adjacencies. The ITM also tracks the supply and demand of current skills, giving employees opportunities to work on projects that help the bank fill critical future roles. Paired with the ITM, an AI learning hub democratizes access to immersive learning experiences, practical case studies and insights from industry experts and thought leaders. Standard Chartered also established future skills academies to build both technical and soft skills, complemented by a new AI layer that curates content and scales learning pathways.

AI Onboarding Assistant (Hitachi)

Company	Goal
HITACHI	Hitachi sought to reduce the time and effort required for onboarding while improving new employee engagement for a large, global workforce, many of whom work remotely. The existing process included manual tasks, took 10–15 days and left many new hire questions unanswered. Queries submitted to the HR team averaged over five days for resolution, creating further delays.
Industry	AI in HR Use Case
Industrial manufacturing	To address these challenges, Hitachi’s IT team built a private AI system using a custom large language model trained on company-specific materials. The model ingested data from corporate sites, presentations, PDFs and employment guides to accurately answer new hire questions and trigger required actions. HR partnered with IT to beta test AI onboarding agents across departments, scaling the solution once KPIs and service-level agreements were met.
HR Function	The solution can analyze documents, personalize responses based on business unit, country or role, and take intelligent actions. For new hires, onboarding agents help answer questions and trigger notifications to various departments, such as IT, for help with technology and process support during onboarding. By automating these tasks and providing real-time answers, the system streamlines onboarding and improves the overall experience for all participants.
